

CNTRICS

**Cognitive Neuroscience Treatment Research
to Improve Cognition in Schizophrenia**

What Criteria Should We Use?

- Tied to the strengths and advantages of cognitive neuroscience tools
- Relevant for treatment development
- Not tied to established psychometric or task properties
- Not constrained by absence of evidence (as opposed to evidence of absence)

Possible Criteria for Cognitive Mechanisms

| |
|---|
| Readily measured in humans |
| Strong evidence of impairment in schizophrenia |
| Linked to functional outcome in schizophrenia |
| Clarity of the understanding/specification of the cognitive system/mechanism |
| Clarity of the link to a specific neural circuit |
| Measures practically amenable for use in human imaging studies |
| Link to neural systems in humans through functional neuroimaging |
| Link to neural systems in humans through neuropsychopharmacology |
| Linked to the signs and/or symptoms of schizophrenia |
| Evidence for amenability to improvement in schizophrenia |
| Degree of homology between the human and animal models |
| Linked to neural system in animals through neuropsychopharmacology |
| Clarity of the link to a specific neurotransmitter system |
| Availability of an explicit animal model |
| Link to neural systems in humans through neuropsychology (e.g., lesion studies) |
| Formal similarity between the measures in humans and animals |
| Associated with schizophrenia relevant genetic polymorphisms |
| Linked to neural system in animals through electrophysiological studies |
| Linked to neural system in animals through lesion studies (reversible or not) |

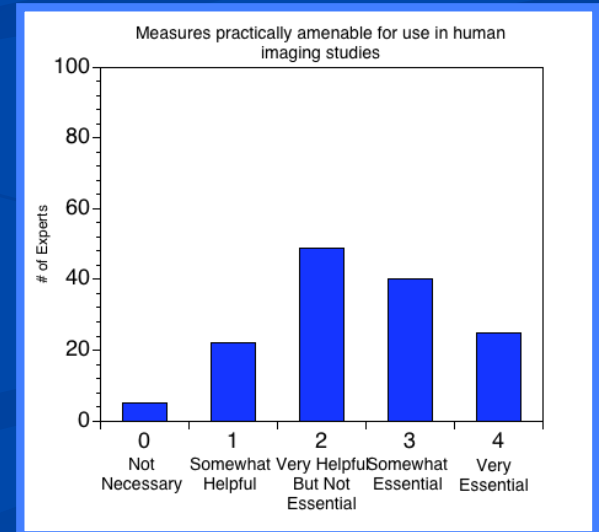

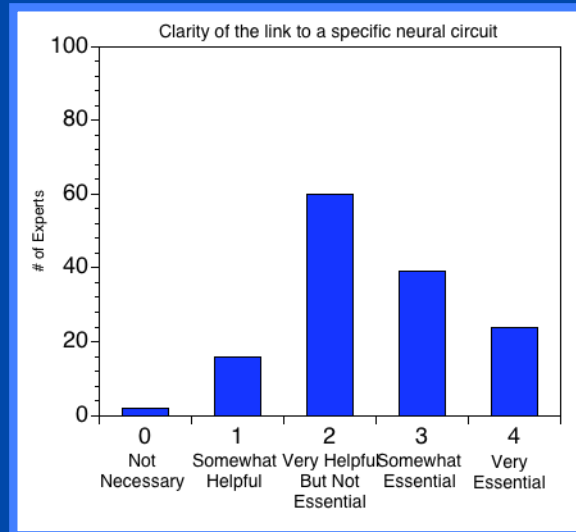

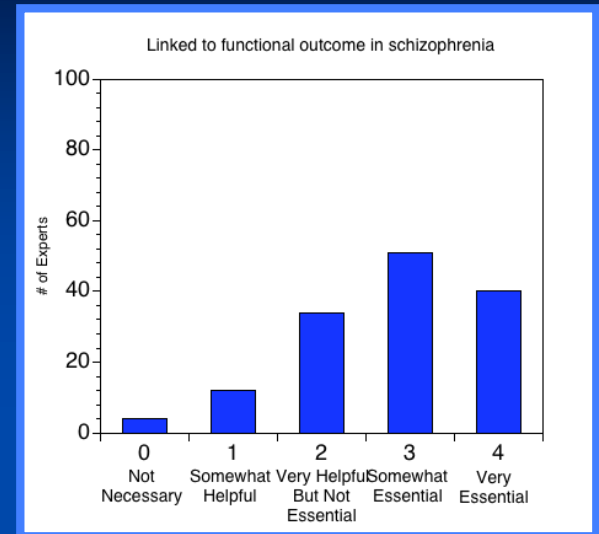

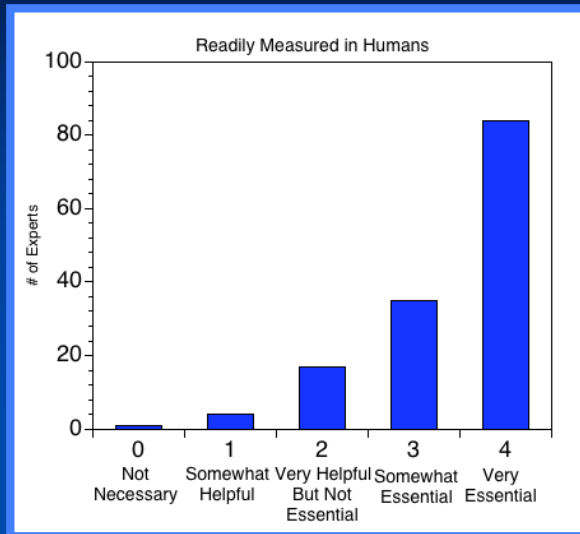

Rating Scale

| Not Necessary | Somewhat Helpful | Very Helpful But Not Essential | Somewhat Essential | Very Essential |
|-----------------------|-----------------------|--------------------------------|-----------------------|-----------------------|
| <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

Results of Survey Criteria

| | Total (N=141) | Academics (N=125) | Industry (N=16) |
|---|------------------|----------------------|--------------------|
| Readily measured in humans | 3.40 (1) | 3.41 (1) | 3.31 (2) |
| Strong evidence of impairment in schizophrenia | 3.35 (2) | 3.34 (2) | 3.50 (1) |
| Linked to functional outcome in schizophrenia | 2.79 (3) | 2.78 (4) | 2.88 (6) |
| Clarity of the understanding/specification of the cognitive system/mechanism | 2.76 (4) | 2.80 (3) | 2.50 (9) |
| Clarity of the link to a specific neural circuit | 2.48 (5) | 2.50 (5) | 2.25(13) |
| Measures practically amenable for use in human imaging studies | 2.41 (6) | 2.44 (6) | 2.19 (14) |
| Link to neural systems in humans through functional neuroimaging | 2.41 (7) | 2.35 (7) | 2.56 (7) |
| Link to neural systems in humans through neuropsychopharmacology | 2.36 (8) | 2.35 (8) | 2.44 (10) |
| Linked to the signs and/or symptoms of schizophrenia | 2.35 (9) | 2.26 (9) | 3.0 (4) |
| Evidence for amenability to improvement in schizophrenia | 2.26 (10) | 2.25 (10) | 2.44 (11) |
| Degree of homology between the human and animal models | 2.14 (11) | 2.04 (12) | 2.94 (5) |
| Linked to neural system in animals through neuropsychopharmacology | 2.11 (12) | 2.05 (11) | 2.56 (8) |
| Clarity of the link to a specific neurotransmitter system | 2.06 (13) | 2.02 (13) | 2.38 (12) |
| Availability of an explicit animal model | 2.06 (14) | 1.92 (5) | 3.13 (3) |
| Link to neural systems in humans through neuropsychology | 1.92 (15) | 1.98 (14) | 1.50 (18) |
| Formal similarity between the measures in humans and animals | 1.79 (16) | 1.78 (16) | 1.94 (15) |
| Associated with schizophrenia relevant genetic polymorphisms | 1.76 (17) | 1.78 (17) | 1.69 (16) |
| Linked to neural system in animals through electrophysiological studies | 1.72 (18) | 1.76 (18) | 1.44 (19) |
| Linked to neural system in animals through lesion studies | 1.71 (19) | 1.73 (19) | 1.56 (17) |

Results of Survey Criteria

Initial Construct List

- Broad coverage
- Starting point, not an ending point
- Input from individuals with diverse backgrounds
 - Human and animal researchers
 - Clinical and basic researchers
 - Academic and Industry

What is in your folder?

- Survey results for total sample
- Survey results by field
 - Animal and human cognitive neuroscience
 - Cognitive neuroscience of schizophrenia
 - Other (sorry!)

Perception

Steve Dakin, Dan Javitt

- Visual motion processing
- Visual form processing
- Visual feature binding
- Gestalt processing
- Auditory perception

Working Memory

Ed Smith, Sohee Park

- Storage
- Updating
- Manipulation
- Control processing

Long-term Learning and Memory

Anthony Wagner, Paul Fletcher, Charan Ranganath

- Encoding (including item and relational)
- Retrieval (item specific and relational)
- Source memory
- Strategy generation and application
- Recollection
- Familiarity
- Semantic memory/representations
- Semantic priming
- Reinforcement based learning

Attention

Steve Luck, Jim Gold

- Attention shifting
- Selection under distraction
- Preparatory attention

Executive Control

Todd Braver, Keith Nuechterlein

- Set-shifting
- Sequencing
- Conflict monitoring
- Conflict resolution
- Meta-cognition
- Planning

Social Cognitive Processing (broadly defined)

Kevin Ochsner, Michael Green

- Facial affect recognition
- Emotion regulation
- Effects of emotion on decision making and memory
- Theory of mind

Post Discussion Ratings

- We will ask you to rate again at the end of the breakout session
 - Adding in or deleting constructs

Breakout Sessions

- Morning (11:30 am to 1:00 pm)
 - Perception: Brookside B
 - Working Memory: Glen Echo
 - Social/Emotion: Linden Oak
- Afternoon (4:30 pm to 6:00 pm)
 - Long Term Memory: Brookside B
 - Executive Control: Glen Echo
 - Attention: Linden Oak
